

# Corporate Onboarding: Privileged & Administrator Accounts

## 1. Definition of Privileged Access

Privileged access refers to administrative rights that allow users to change system configurations, bypass security controls, or access sensitive system directories. Examples include:

- Local Administrator: Administrative rights on your issued corporate laptop.
- Domain Administrator: Management access across the Active Directory domain.
- Root/Superuser: Access to systems or servers at the highest privilege level.
- Service Accounts: Non-human accounts used by software applications.

## 2. Temporary Local Administrator Access

To install specialized software or modify system network interfaces on your company-issued device, use the MakeMeAdmin app (Windows) or Privileges app (macOS). Privilege escalation is granted for 30 minutes per session.

## 3. Persistent Privileged Accounts (Domain / Server Admin)

Secondary Admin Accounts: You must request a separate account prefixed with adm- (e.g., adm-jdoe). Request via SailPoint Identity Portal -> 'Create Administrative Account'.

CyberArk PAM: For root and database admin access, credentials are managed through CyberArk PVWA console at <https://cyberark-vault.corp.internal>.
